

7T10 discovery figure: contact-localized tensile mechanics

A. Contact concentration defines load-anchor residues

B. Tensile response with accepted/rejected models

C. AIC gate rejects extension-free descriptor

D. Scientific interpretation

Mechanics claim
7T10 supports a contact-localized tensile mechanics
interpretation: a small hotspot set concentrates
structural anchoring while the force trace passes a linear
tensile-response gate with measurable stiffness, work, and
peak force.

Stress test: contact-only ablation
New regime adds: entropy/Gini concentration, load-anchor index, AIC-gated tensile descriptor
